- What’s new in 2.1
- What’s new in 2.2

1. What My Finances Planner does for you

My Finances Planner helps you plan the month the way salary actually works. If you get paid on the 27th, your “month” can run from the 27th to the 26th — not only from the 1st to the 31st. You can also start on day 31; short months use the last real calendar day.

With the app you can:

- See how much income you have for a cycle, and what’s left after planned bills and expenses.
- List every bill and mark each month as paid or unpaid.
- Track installment plans and link them to payments.
- Log everyday spending (groceries, fuel, food, shopping, or your own categories).
- Watch savings grow when you mark a Savings payment as paid, or add an entry toward a goal.
- Estimate end-of-service for GCC countries, UAE public or domestic work, or a custom Other formula.
- Export a PDF summary or add a balance pass to Apple Wallet.
- Use the same data on iPhone, iPad, Mac, and Apple Watch when iCloud is on.

Overview on iPhone: due items, cards, and the selected cycle range.

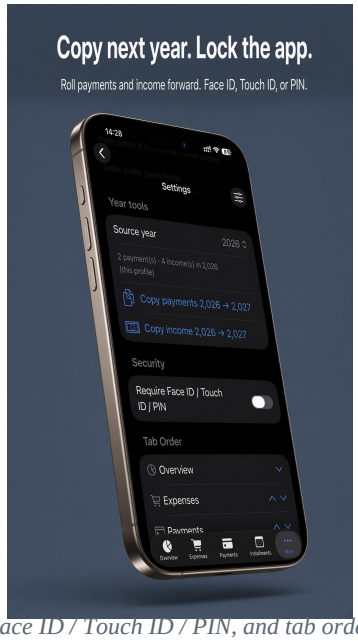

2. Getting started

When you open the app

You’ll see a short splash, then either your main tabs or a lock screen if security is turned on.

Keeping the app private

Unlock with Face ID on iPhone or Touch ID on Mac. Optionally set a PIN as a backup. Turn this on or off anytime in Settings. If you leave the app for a few minutes, it can lock again automatically.

Year tools, Face ID / Touch ID / PIN, and tab order on iPhone.

TIP

Security only controls opening the app on that device. Your Apple ID and iCloud still protect cloud data.

3. Profiles & your billing cycle

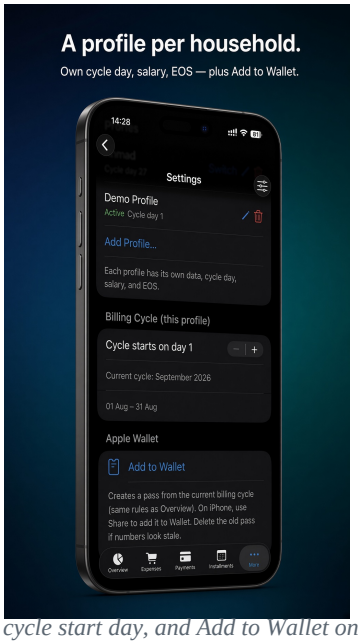

A profile is a separate set of numbers — useful if you track your own money and someone else’s, or personal versus another budget.

Each profile has:

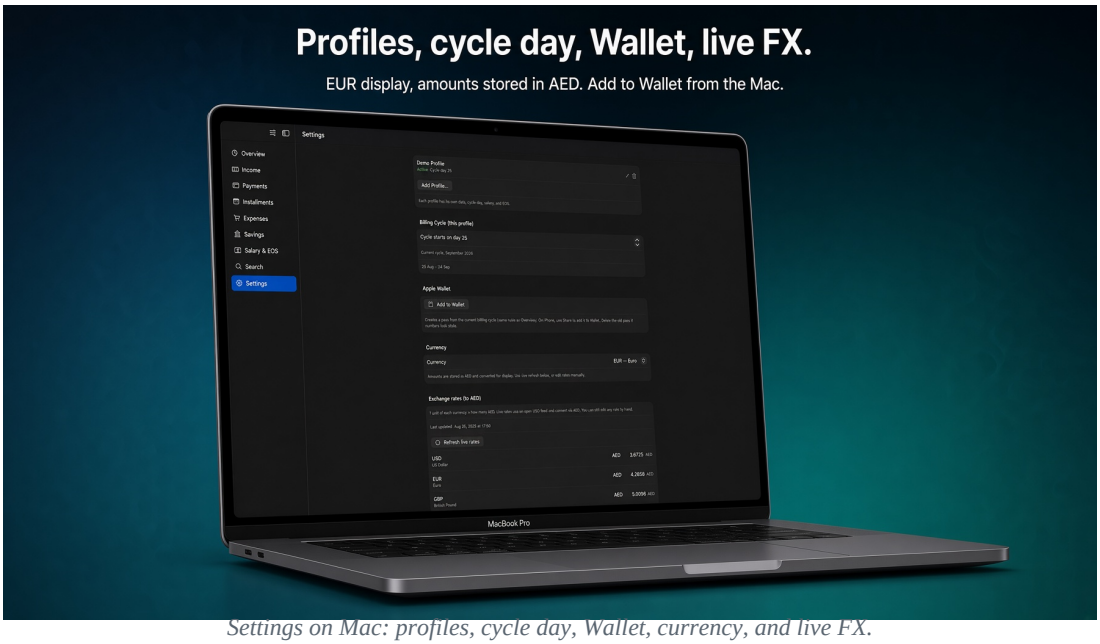

- Its own income, payments, expenses, savings, and installments
- Its own salary details and EOS calculation
- Its own cycle start day (1 through 31) and display currency

How to switch or add a profile

- Open Settings (on iPhone, use the More tab if Settings is not in the main row).
- At the top, tap a profile to switch, or Add Profile… to create one.
- Use the pencil to rename, or the trash icon to delete (that profile’s data goes with it).

Profiles, cycle start day, and Add to Wallet on iPhone.

Settings on Mac: profiles, cycle day, Wallet, currency, and live FX.

Your billing cycle

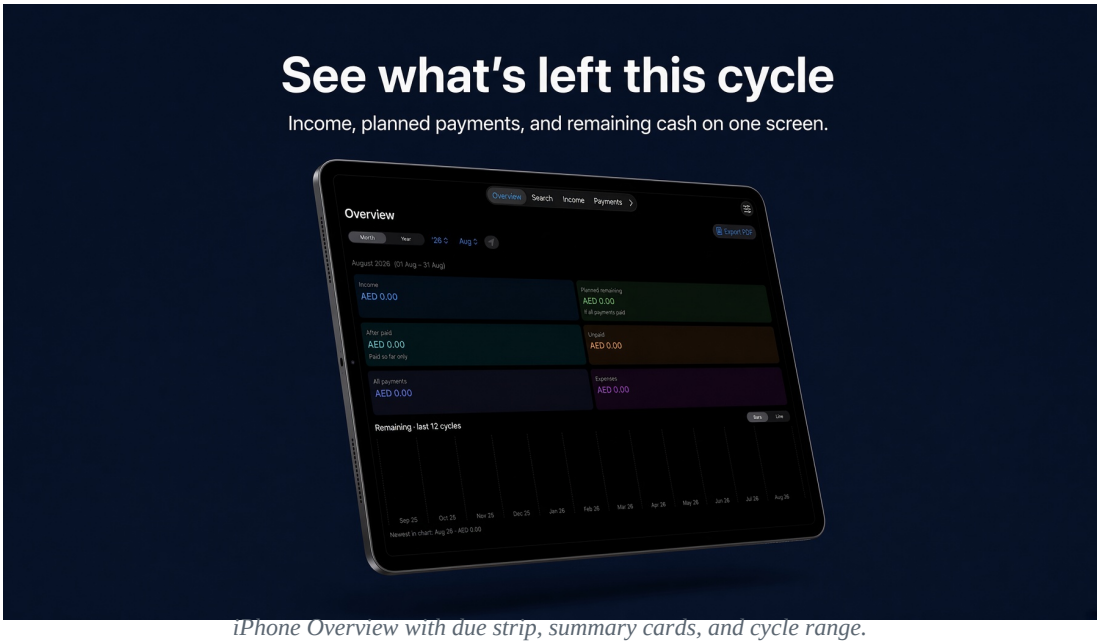

Under Billing Cycle, choose which day of the month your cycle starts. Day 1 gives ranges like 01 Aug – 31 Aug. Day 27 might show 27 Jul – 26 Aug for the cycle that ends in August. Day 31 starts on the 31st when the month has 31 days, or on the last day of a shorter month (28 or 29 February, 30 April, and so on).

TIP

Match the cycle start day to when your salary usually arrives. Overview, Income, and Payments follow that rhythm. Due dates on bills stay calendar days (the 16th of October), separate from the cycle length.

4. Overview — your money at a glance

Overview is the home dashboard for the profile you're using. Pick Month or Year, then choose the year and cycle. The location button jumps back to the current cycle.

iPhone Overview with due strip, summary cards, and cycle range.

What the coloured cards mean

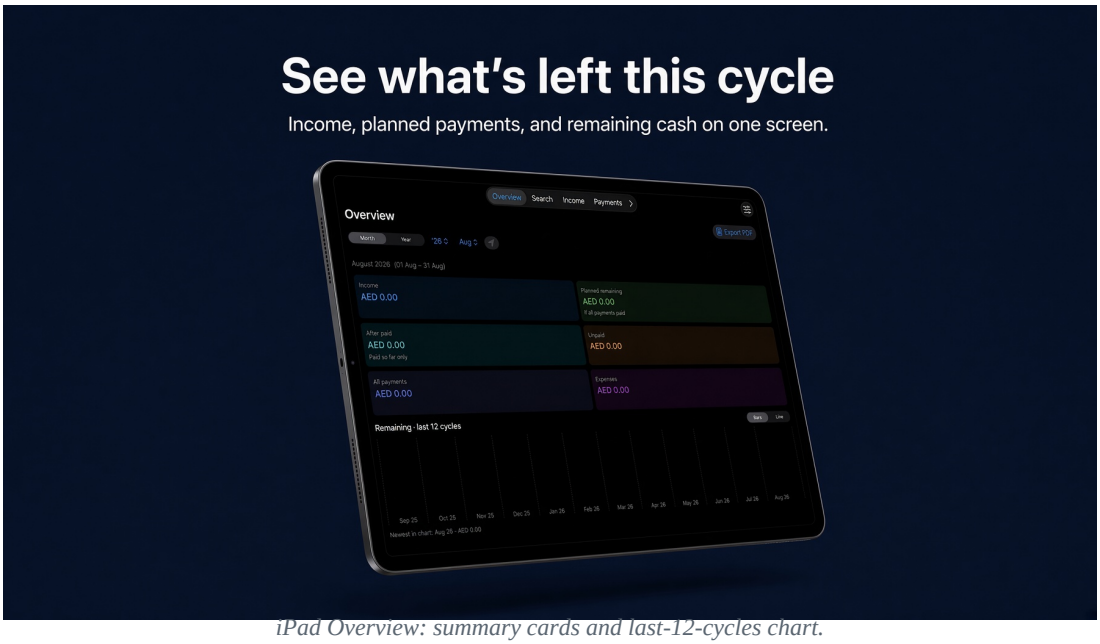

- Income — money you recorded for this cycle.
- Planned remaining — what's left if every payment in the plan is paid.
- Current remaining / After paid — income minus only what you've already marked paid, minus expenses.
- Unpaid — total still unchecked for this cycle.
- All payments — sum of payments that belong to this cycle.
- Expenses — day-to-day spending you logged for this cycle.

Due today & overdue

When something is due today or late, a warning card lists those payments with the real calendar date (for example Aug 1), not a cycle-day number.

Charts & history

On larger screens you can see remaining over the last 12 cycles as bars or a line. Tap This cycle to return after browsing older months.

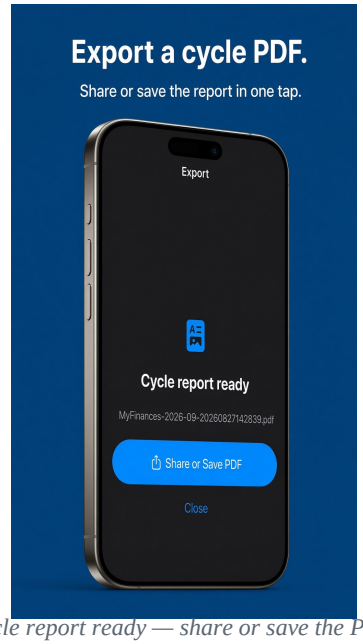

iPad Overview: summary cards and last-12-cycles chart.

Overview on the Mac

On the Mac, Overview uses the sidebar. Mode, year, cycle, This cycle, and Export PDF sit on one row. Upcoming items for the cycle appear above the cards. The doughnut chart and last-12-cycles history sit below.

Export PDF

Tap Export PDF to share or save a summary of the cycle you're viewing — income, paid and unpaid payments, expenses by category, and remaining.

Cycle report ready — share or save the PDF.

5. Income

Use the Income tab to record what you receive each cycle. Choose the year, add a month/cycle, amount, and an optional note. Each row shows the cycle range under the month name (for example 01 Aug – 31 Aug), not a plain calendar month.

If you've filled in Salary & EOS, the app can suggest your total monthly salary as the default amount when you add income.

- Search the list when you have many entries.
- Edit or delete a row when something changes.
- Copy income into the next year from Settings → Year tools so you don't retype everything.

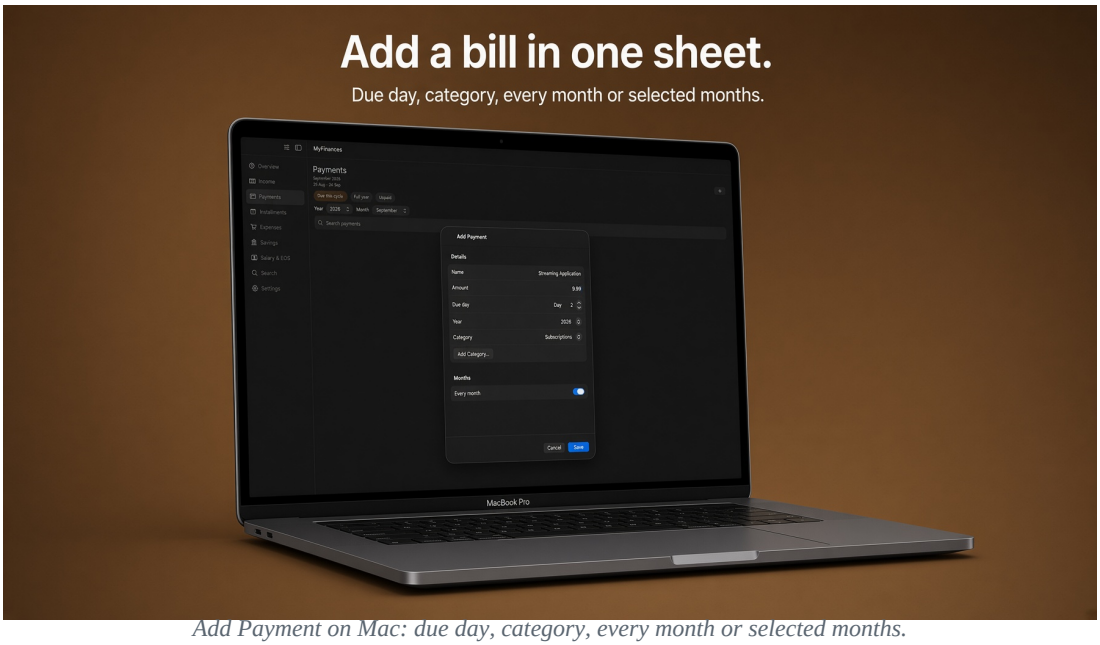

Income on iPhone: year total, default from salary, and cycle ranges.

6. Payments

Payments are planned bills: rent, utilities, subscriptions, installments, or transfers to savings.

Adding a payment

- Tap the + button.
- Enter the name and amount.
- Set the due day (1–31). This is the calendar day of the month, not the day number inside the cycle.
- Choose the year and which months it applies to, or Every month.
- Pick a category (or create your own). Use Savings if the money should appear under Savings when marked paid.
- Save.

Add Payment on Mac: due day, category, every month or selected months.

Marking months paid

Each month can be on or off independently. A yearly bill can be paid for January–July without marking August yet.

Filters

Use Due this cycle to focus on what matters now, or Full year / All months when you need the big picture. Search by name when the list is long.

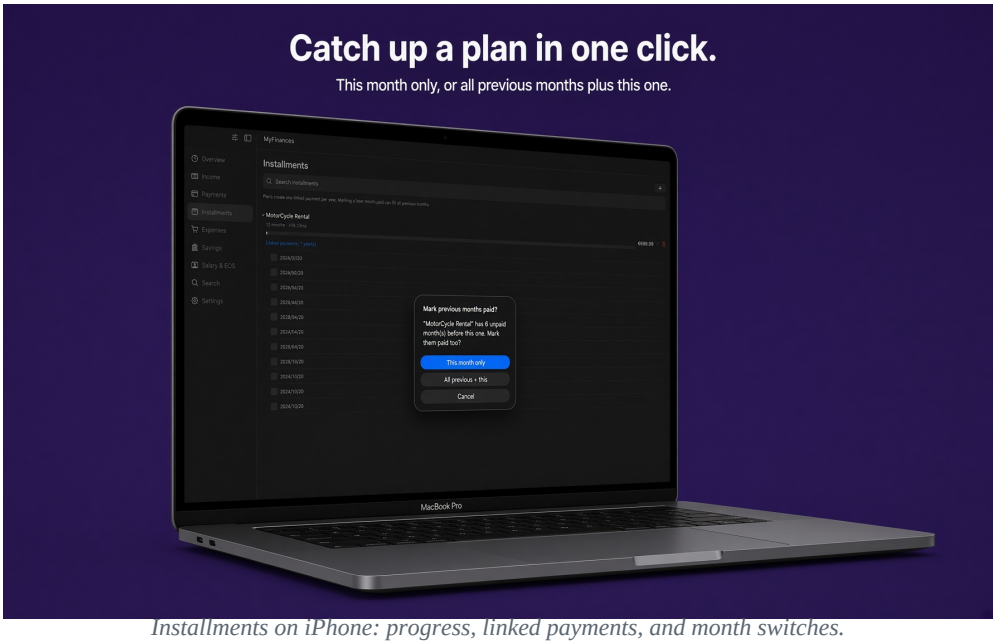

TIP
If the category is Savings and you mark a month paid, the amount can appear under the Savings tab and on your Wallet pass.

7. Installments

Installments are for multi-month purchases. When you save a plan, the app creates matching payment rows so you can track each due month in Payments as well.

Adding a plan

Enter the name, start date, total amount, monthly amount, and number of months. Fill total and months — or monthly and months — and the other field updates. Amounts use two decimal places. Long plans create one linked payment per year.

Installments on iPhone: progress, linked payments, and month switches.

Catch up earlier months

When you mark a later month paid, the app can ask whether to mark only this month, or all previous unpaid months plus this one.

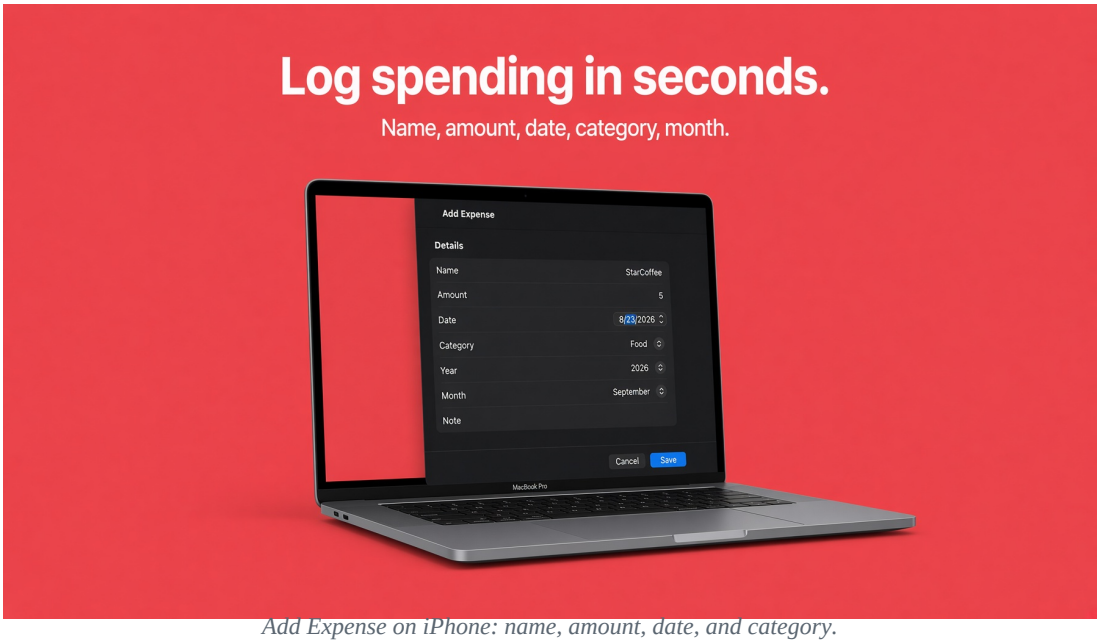

> **TIP**
> Use All previous + this when you have caught up on a loan and don’t want to tap every earlier switch.

8. Expenses & category caps

Expenses are everyday spending inside a cycle — after you've planned bills. They reduce what's left on Overview.

Add an expense

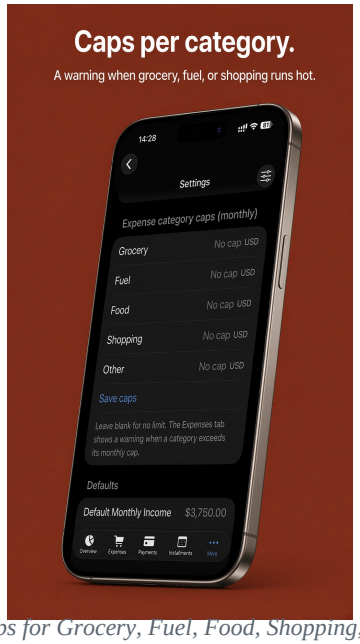

- Name, amount, date, category, year, month, and an optional note.
- Categories include Grocery, Fuel, Food, Shopping, Other, or one you create.

Add Expense on iPhone: name, amount, date, and category.

Caps per category

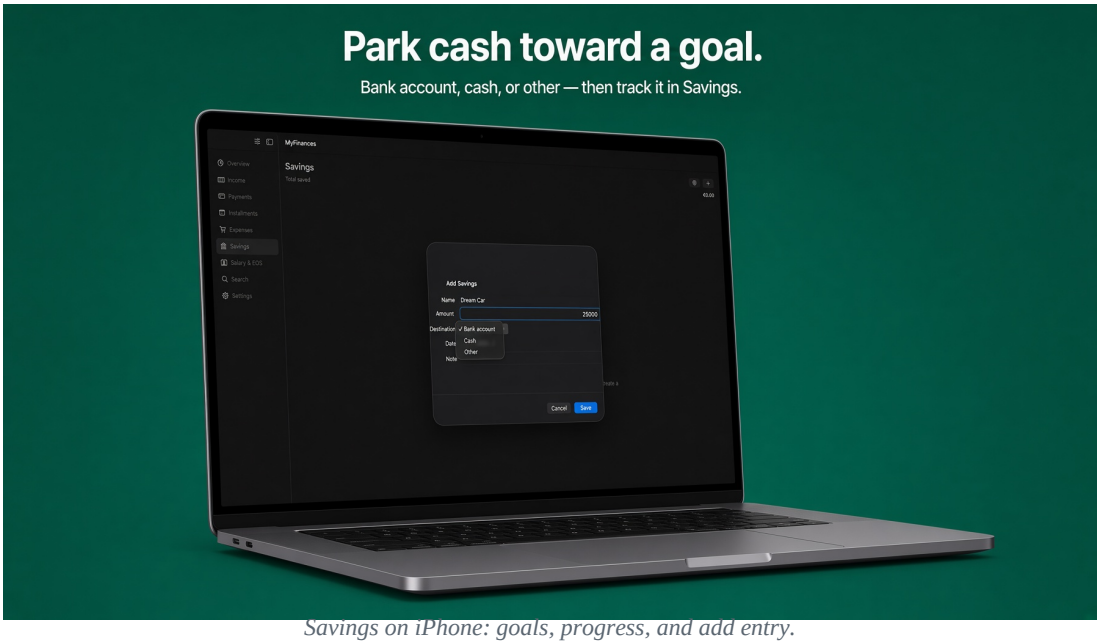

In Settings → Expense category caps, set a monthly limit per category. Leave blank for no limit. The Expenses tab shows a warning when a category exceeds its cap.

Monthly caps for Grocery, Fuel, Food, Shopping, and Other.

9. Savings & goals

Savings grow when you treat a payment as a Savings transfer and mark it paid, or when you add an entry in the Savings tab. You can also set a goal (target amount) and watch progress toward it. Name savings entries with the goal name so they count toward that goal.

Savings on iPhone: goals, progress, and add entry.

On the Mac you can choose a destination when adding savings: bank account, cash, or other.

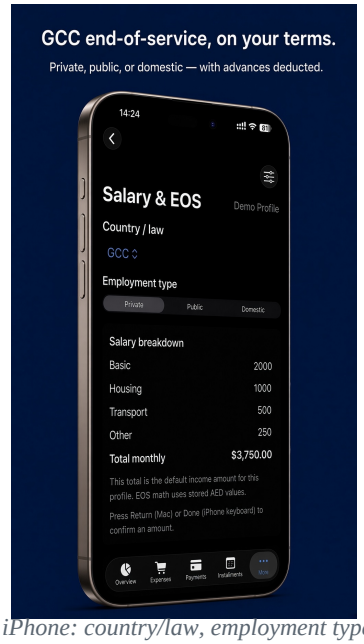

TIP
Your total savings for the active profile can appear on the Apple Wallet pass.

10. Salary & End of Service (EOS)

Salary & EOS stores the monthly breakdown for this profile and estimates a leaving award. Figures are for planning only. Confirm final amounts with your employer or official guidance.

Salary breakdown

Enter Basic, Housing, Transport, and Other. Total monthly becomes the default income amount for this profile. Values are stored in AED; the screen converts them when you change currency.

Salary & EOS on iPhone: country/law, employment type, and breakdown.

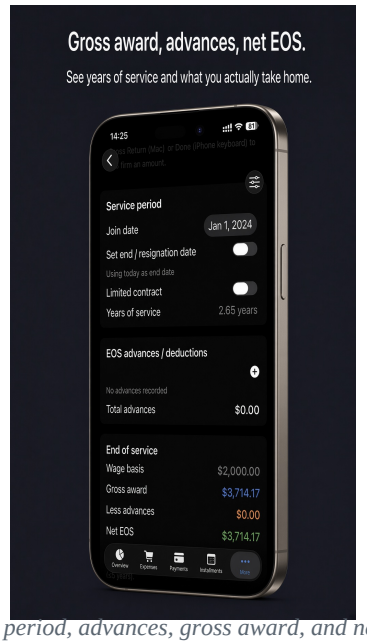

Country / law

Choose UAE, another GCC country (Saudi Arabia, Qatar, Kuwait, Bahrain, Oman), or Other.

- UAE Private — typical 21 days per year for the first five years, then 30 days, on basic wage.
- UAE Public — public-sector style estimate.
- UAE Domestic — domestic-worker rules used in Dubai planning.
- Other GCC — built-in estimates for that country's common private-sector pattern.
- Other — type your own days per year for early years and later years, and whether the basis is gross or net.

Employment type & service period

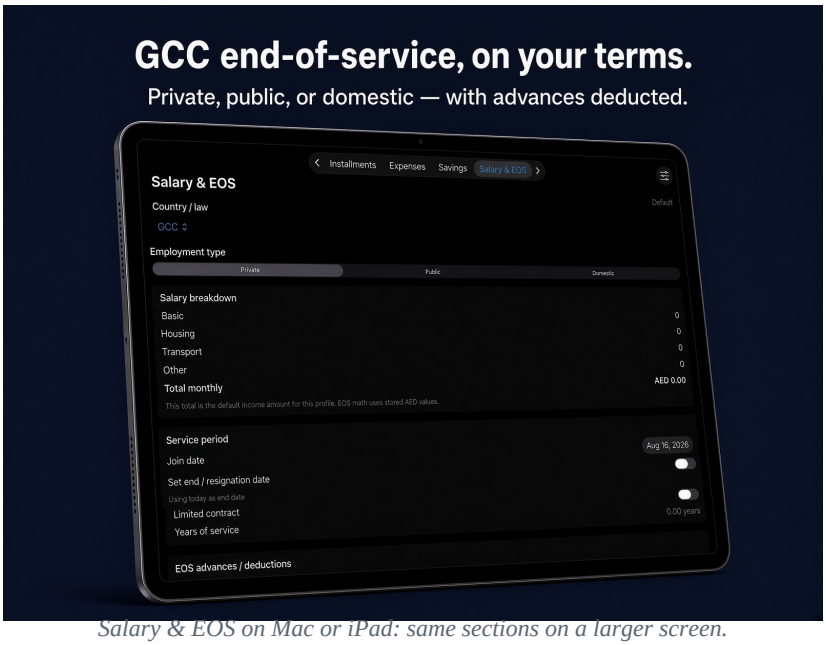

Choose Private, Public, or Domestic where the country offers those types. Set join date; optionally set a resignation date or limited contract. Years of service update automatically.

Service period, advances, gross award, and net EOS.

EOS advances

If you took advances against end of service, add them with a date. Net EOS is the estimate after those deductions.

Salary & EOS on Mac or iPad: same sections on a larger screen.

> **NOTE**
> EOS math always uses stored AED amounts. Changing the display currency does not rewrite the legal estimate; it only changes how numbers look on screen.

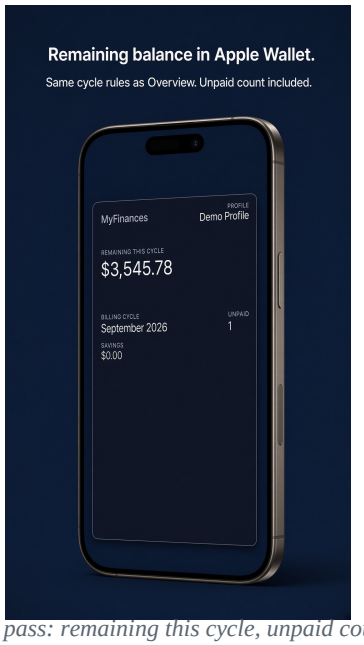

11. Search

Open the Search tab to look across income, payments, expenses, installments, and savings for the active profile. Lists such as Payments and Income also have their own search field when you only need that section.

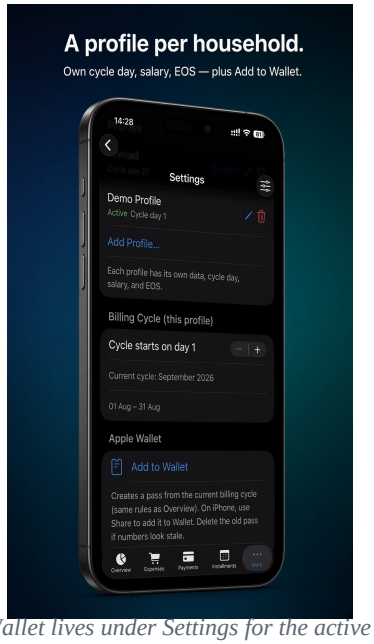

12. Settings

Apple Wallet

Add to Wallet creates a pass with your current cycle snapshot — remaining balance, unpaid count, profile name, billing cycle label, and savings. On iPhone the app can open Wallet directly. On Mac it builds the pass for you to add. Delete an old pass in Wallet if numbers look stale, then add a new one after you update payments.

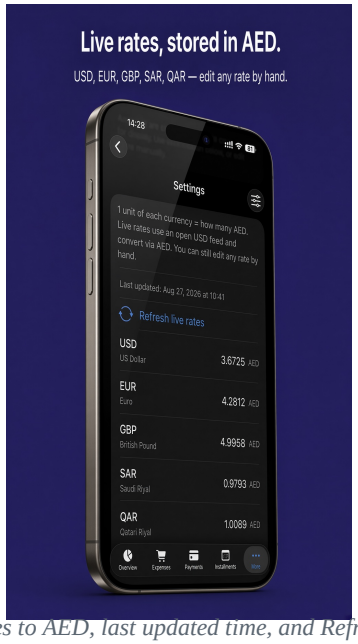

Apple Wallet pass: remaining this cycle, unpaid count, savings.

Add to Wallet lives under Settings for the active profile.

Currency & exchange rates

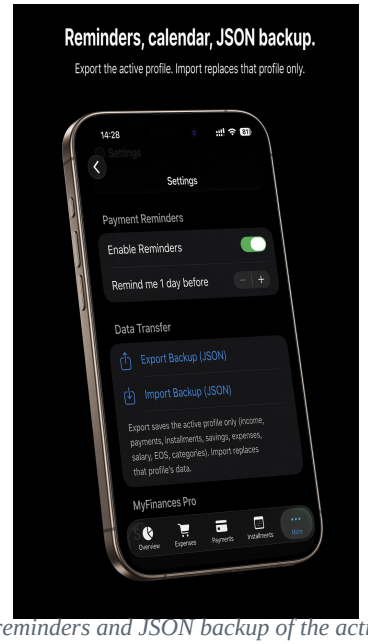

Amounts are stored in AED and shown in the currency you pick (USD, EUR, GBP, SAR, QAR, and others). One unit of each currency equals how many AED. Refresh live rates when you have a network connection, or edit any rate by hand. Use your bank for official conversion when it matters.

Exchange rates to AED, last updated time, and Refresh live rates.

Reminders & calendar

Turn on payment reminders and choose how many days before the due date to notify you. You can also send reminders into Calendar. Due dates follow the calendar day of the month inside your billing cycle.

Payment reminders and JSON backup of the active profile.

Year tools

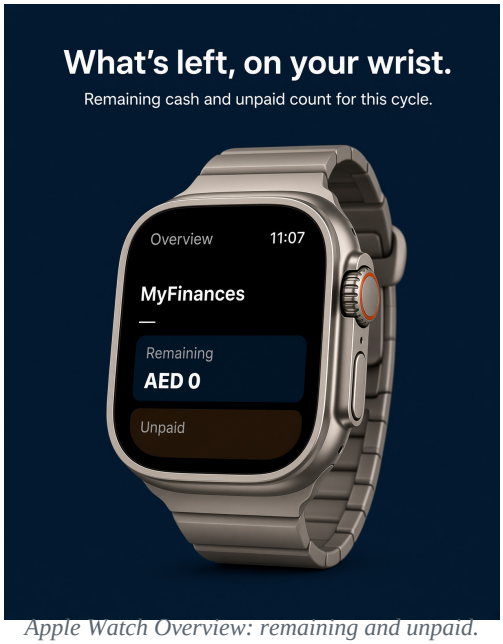

Copy payments or income from the source year into the next year so January planning is faster.

Other Settings

- Reorder tabs so your favourite screens are first.
- Export or import a JSON backup. Export saves the active profile only. Import replaces that profile’s data.
- Reset all app data (permanent — confirm carefully).
- Privacy policy and Contact Developer in About.

13. Apple Watch & widgets

On the Watch you can see remaining money and unpaid counts for the current cycle. Keep the iPhone nearby with the Watch app installed.

Apple Watch Overview: remaining and unpaid.

Home Screen widgets on iPhone show the same style of summary. Open Overview once in the main app if a widget still shows zeros — that publishes a fresh snapshot.

14. Syncing across your devices

When iCloud is on and you use the same Apple ID on iPhone, iPad, and Mac, changes can appear on every device. Stay on Wi-Fi after big imports so sync can finish.

TIP
After installing the app, give sync a few minutes. On each device, select the same profile name to see the same numbers.

Currency for a profile follows that profile. Switch profile on another device and the display currency should match once Settings has opened.

15. Quick tips & common questions

Why does Overview show a cycle like 27 Jul – 26 Aug?

Because this profile's cycle starts on day 27. Change it under Settings → Billing Cycle if you want calendar months (day 1) or another payday.

Why does February end on the 27th when my cycle starts on the 31st?

February has 28 days in a common year. The next cycle "start" in February is the last real day (the 28th), so the February cycle ends the day before. March then runs from 28 Feb toward the end of March.

Why is planned remaining negative?

Planned payments for that cycle add up to more than recorded income. Add income, reduce plans, or check you're on the right profile and month.

A payment doesn't show in this cycle

Check due day, year, and which months are selected. Membership follows the due calendar date plus your cycle start day — not "day 16 of the cycle."

Widget or Watch shows 0

Open Overview on iPhone or Mac so the app publishes a fresh summary, then check again.

Wallet pass numbers look old

Generate a new pass from Settings after you update payments or savings. Remove the old pass from Wallet if you like.

Salary lines didn't convert but the total did

Confirm the amount and press Return (Mac) or Done (iPhone). Totals use the shared currency formatter; each field converts when you finish editing.

EOS changed after I picked another country

Each country uses its own estimate. Other lets you type days and Gross/Net. Switch back to UAE to restore the UAE formula.

Thank you for using My Finances Planner. For support, use Contact Developer in Settings → About.

— End of guide —

What’s new in version 2.0

This edition matches the 2.0 app. The main additions since 1.1:

- GCC end-of-service estimates (UAE, Saudi Arabia, Qatar, Kuwait, Bahrain, Oman) plus a custom Other formula.
- Billing cycle start day 1–31, including short months (February clamps to the last real day).
- Due dates use the calendar day of the month (for example 16 Oct), not a day-number inside the cycle.
- Currency display with rates to AED. Refresh live rates or edit any rate by hand. Amounts stay stored in AED.
- Add to Wallet from iPhone or Mac for the current cycle remaining balance.
- Expense caps per category, with a warning when a category runs hot.
- Installment plans can mark this month only, or all previous months plus this one.
- Copy payments and income into the next year from Settings.
- Overview history chart (last 12 cycles) and cycle PDF export.
- Reminders, calendar export, JSON backup of the active profile, Face ID / Touch ID / PIN.

What’s new in 2.1

This chapter covers features added after 2.0: credit cards, paying from a card, installment type and source, Home Screen widgets, Apple Watch, Mac widgets, and an updated Wallet pass. Everything in the 2.0 chapters still applies.

Credit Cards

Open the Cards tab to store a nickname, credit limit, and due day. The app never stores a card number or expiry date.

One card is free. Extra cards require MyFinances Pro.

Owed is the sum of payments and expenses you marked as paid from that card. Remaining is limit minus owed. Overview shows a line per card.

When you add a payment or expense, Paid from defaults to Income. Choose Credit Card and pick the nickname to deduct from that card instead.

The app creates a bill payment for the card due day in the next billing cycle. Paying that bill does not increase the card owed again. If you delete a card, existing rows stay and go back to Income.

> **TIP** If a new charge would push remaining below zero, the app warns you before you save.

Installment type and source

Each installment plan now has a type (Other, Credit Card, Tamara, Tabby, or similar) and an optional source (bank or company name). These are labels only. Monthly amounts still create the same linked payments as in 2.0.

Widgets on iPhone

After you open Overview once, add a widget from the Home Screen. There are three styles:

- **Snapshot** — cycle name, planned remaining, first card remaining, unpaid count.
- **Overview tiles** — large widget with income, planned left, current left, unpaid, and the first card.
- **Due this cycle** — unpaid bills with dates.

Widgets refresh when you open Overview. If numbers look old, open Overview and wait a few seconds.

Apple Watch

The Watch widget shows cycle remaining, unpaid count, and the first card on the rectangular face. The Watch app shows current left, planned left, unpaid count, cards, and due this cycle. Open Overview on iPhone, then tap Refresh on the watch if the list is empty.

Mac widgets

Mac App Store users get Snapshot, Overview tiles, and Due this cycle without installing the iPhone app. Open Overview on the Mac once, then add the widgets from Notification Center or the desktop.

Wallet pass

Add to Wallet still lives in Settings. The pass now also shows a Cards row (nickname and remaining) under savings. Generate a new pass after you change cards or payments. Remove the old pass in Wallet if the snapshot looks stale.

iCloud

Cards, the card you pay from, and installment type and source sync with the same Apple ID on iPhone and Mac. Both devices must use version 2.1.

What’s new in 2.2

This chapter covers changes after 2.1. Everything in the 2.0 and 2.1 chapters still applies.

Wallet pass matches Overview

Add to Wallet now uses the same **current remaining** figure as Overview (income minus payments already marked paid, minus expenses). Card-bill lines are not added on top of that number.

Open Overview once before you generate a pass so the snapshot is fresh. Delete the old pass in Wallet, then add the new one.

What the pass shows

Front of the pass
• Income remaining (current remaining for this cycle)
• Savings and unpaid count
• Up to two cards (nickname and remaining)

Back of the pass
• Billing cycle label
• Full card list if you have more than two cards

A Wallet pass cannot show unlimited rows on the front. Extra cards stay on the back.

Widgets and Watch

No change to how you add widgets. Snapshot, Overview tiles, Due this cycle, Watch, and Mac widgets still update when you open Overview.

iCloud

Use 2.2 on every device that shares the same Apple ID so cards, funding source, and installment type stay in sync.
